

Detailed Step-by-Step Ubuntu VM Setup Guide

This guide explains every small step required to create Ubuntu Virtual Machines using VirtualBox on Ubuntu.

Step 1: Open Terminal

Press CTRL + ALT + T to open terminal.

Step 2: Update Ubuntu

Type:
`sudo apt update`

Step 3: Install VirtualBox

Type:
`sudo apt install virtualbox -y`

Step 4: Wait for Installation

Wait until installation finishes completely.

Step 5: Open VirtualBox

Type:
`virtualbox`

Step 6: Download Ubuntu ISO

Open browser → go to ubuntu.com/download/desktop → download Ubuntu 22.04 LTS ISO

Step 7: Open VirtualBox New VM Wizard

In VirtualBox click the blue 'New' button.

Step 8: Enter VM Name

Type VM1 in the Name field.

Step 9: Select Type

Choose Linux.

Step 10: Select Version

Choose Ubuntu (64-bit).

Step 11: Select ISO File

Click the dropdown beside ISO Image → click Other → select Ubuntu ISO file.

Step 12: Continue Setup

Click Next.

Step 13: Create Username

Enter username: vagrant

Step 14: Create Password

Enter password: vagrant

Step 15: Confirm Password

Re-enter password: vagrant

Step 16: Continue

Click Next.

Step 17: Allocate RAM

Set memory size to 2048 MB.

Step 18: Allocate CPU

Set processors to 2.

Step 19: Continue

Click Next.

Step 20: Create Hard Disk

Set disk size to 20 GB.

Step 21: Finish VM

Click Finish.

Step 22: Start VM

Select VM1 → click Start.

Step 23: Wait for Ubuntu Installation

Ubuntu installation starts automatically. Wait patiently.

Step 24: Restart VM

VM may restart automatically after installation.

Step 25: Login

Enter username: vagrant and password: vagrant

Step 26: Create VM2

Repeat all steps again and create second VM named VM2.

Step 27: Open VM Settings

Right click VM1 → Settings.

Step 28: Open Network Settings

Click Network tab.

Step 29: Select Bridged Adapter

Change Attached To → Bridged Adapter.

Step 30: Save Settings

Click OK.

Step 31: Repeat for VM2

Apply same network settings for VM2.

Step 32: Start Both VMs

Boot both VM1 and VM2.

Step 33: Open Terminal in VM1

Press CTRL + ALT + T.

Step 34: Install SSH

Type:

```
sudo apt install openssh-server -y
```

Step 35: Repeat SSH Installation

Install SSH in VM2 also.

Step 36: Find IP Address

Type:
ip addr

Step 37: Note IP Address

Find inet address like 192.168.x.x

Step 38: Create File

Type:
touch file.txt

Step 39: Edit File

Type:
nano file.txt

Step 40: Write Text

Write: Hello from VM1

Step 41: Save File

Press CTRL + O → ENTER → CTRL + X

Step 42: Transfer File

Type:
scp file.txt vagrant@IP_OF_VM2:/home/vagrant

Step 43: Enter Password

Type password: vagrant

Step 44: Verify Transfer

On VM2 type:
cat file.txt

You have successfully created Ubuntu virtual machines and transferred files between them using SCP.
