

GitHub Version Control Practical

Aim: To create a version control account on GitHub and use Git commands to create a repository and push files to GitHub.

Commands To Execute In Visual Studio Code Terminal

For Pushing First File

```
# Check Git Installation
git --version

# Initialize Git Repository
git init

# Add Files to Staging Area
git add .

# Check Repository Status
git status

# Connect Remote GitHub Repository
git remote add origin "link of your github repository"

# Commit Changes
git commit -m "First Commit"

# Configure GitHub Authentication (If Prompted)
git config --global user.email "your github email id"
git config --global user.name "your github username"

# Push Code to GitHub
git push -u origin master

# Check Final Status
git status
```

Result: The first file is successfully pushed to the GitHub repository.

For Pushing Second File

```
# Add New File
git add .

# Check Status
git status

# Commit Second File
git commit -m "Second Commit"

# Push Changes to GitHub
git push -u origin master

# Check Final Status
git status
```

Result: The second file is successfully pushed to the GitHub repository.

Conclusion: Successfully created a GitHub repository and pushed files using Git commands through Visual Studio Code terminal.
